

(a) Gaussian profile likelihood ratio

(b) Huber objective, quasi-LR scale

$\sigma^* = 2/(2 + a_1 + b_1)$ held fixed; $E, A, B, a_1/(a_1 + b_1)$ and κ profiled out

— Full design ($n = 240$)

— On-path band $|\Delta \ln M| \leq 0.15$ ($n = 41$)
